

WHITEPAPER

Duck Bank

QAK

Named-shop credit on the XRP Ledger.

One pool. One retailer. One receipt.

1,000,000,000 QAK

Minting in Q4 2026.

Live pools after the XRPL vault amendments.

1. The desk

Duck Bank lends working capital to a named shop on the XRP Ledger. The loan is for a delivery, a counter, or a short fit-out. It is not a revolving line for a trading firm, and it is not a pool that mixes many borrowers into one receipt.

A lender funds one shop, in RLUSD, and holds a receipt for that shop only. If the shop misses, the loss stops there. The next shop is a different vault.

QAK is the token of the desk. It lists a shop, sits first-loss under one pool, cuts the fee, orders a full queue, votes a listing and a cap, and backs a default-cover pot. RLUSD is what is lent. The pool share is what the lender holds.

2. A pool

A retailer applies with the shop name, the city, the purpose, the draw cap, the rate, the term, and a QAK listing lock. Holders vote the listing and the cap. The pool then moves from applied, to listed, to drawn, to repaying, and then to repaid, late, or defaulted.

On the ledger, the shop is its own single-asset vault. Lenders deposit RLUSD and receive shares of that vault. The shop draws up to the cap. Interest stays in the pool. The first pools are at or under 10,000 RLUSD, and short.

3. Tokenomics

QAK is created on FirstLedger in the fourth quarter of 2026. Supply is 1,000,000,000, fixed. Half is sold into the opening pool. Half is the issuer allocation, and that half is earmarked before launch.

Bucket	Of supply	Tokens	Use
Public pool	50%	500,000,000	Opening liquidity against 50 XRP. The XRP side is burned.
Team	10%	100,000,000	Founder, CTO, and developers. Comes out of the issuer allocation.
Marketing	20%	200,000,000	Listings, content, and the shop desk. Comes out of the issuer allocation.
AMM	20%	200,000,000	Added to the QAK/XRP pool after unlock. Comes out of the issuer allocation.

FirstLedger escrows the whole 500,000,000 issuer allocation. Escrow 1 is fixed: 25 percent, 125,000,000 QAK, delivered 24 hours after creation. Escrow 2 is the other 75 percent, 375,000,000 QAK. Its date must be at least one month after the form is signed. A date of 7 November 2026 is too soon if the token is created on 7 October.

Fair launch settings

Initial liquidity is 50 XRP. The form minimum is 25 XRP. The AMM pool fee is 1 percent. Anti-sniper launch is on, for 15 minutes. FirstLedger takes a temporary deposit to cover protocol fees and reserves. What remains after those fees and reserves is returned at the end of the 15 minutes.

The issuer is blackholed after launch, so no more QAK can be minted and the issuer cannot seize a balance on the ledger. A listing lock is bought from the pool, the same way any other holder buys QAK.

Use of QAK

Listing. A shop locks 250,000 QAK to be listed. If the shop defaults, the app treats that lock as seized.

First-loss. A holder locks QAK under one named pool before the draw. Repayment releases the lock. A shortfall takes that QAK before the RLUSD lenders. Anything still unpaid stays in that pool. The cushion is only what was locked.

Fee. The protocol fee is 1.00 percent of interest paid, or 0.75 percent for an account holding at least 100,000 QAK. The fee is taken in RLUSD.

Queue and vote. Locked QAK orders the queue when a pool is full. It does not reserve a fill. One QAK is one vote, on listing and on draw cap only. A vote cannot move another pool's deposits.

Cover pot. Half of protocol fees, plus seized stake, goes to the pot. The pot pays the next default only up to its balance, then stops.

4. First-loss, worked

A lender places RLUSD into a bakery pool. Another account locks QAK against that same pool before the draw. If the bakery repays, the RLUSD lenders are paid first, the lock is released, and any first-loss reward comes only from interest that pool collected.

If the pool is short 400 RLUSD and the locked QAK is worth 400 RLUSD at the snapshot, the QAK side is taken and the lenders are left whole. If the locked QAK is worth 150 RLUSD, the lenders eat the other 250. Marina's pool is not touched.

Because the issuer is blackholed, the seizure is an app rule against a published balance. It is not a ledger clawback. The lock has to be posted before the draw, and it cannot be pulled while the loan is open.

5. Roadmap

Minting is dated. Live production is not. It waits on the amendments.

When	Step	What opens
Q4 2026	Mint	Create QAK. 1,000,000,000 fixed. 50 XRP liquidity. 1 percent pool fee. Anti-sniper 15 minutes.
Q4 2026	Desk	The app reads a QAK balance. Applications open. Deposits stay closed.
Q4 2026 – Q1 2027	One shop	One named retailer. Xaman signs a test payload. Listing needs 250,000 QAK visible.
Amendments enabled	Devnet	VaultCreate and VaultDeposit. One shop, cap at or under 10,000 RLUSD.
After a clean devnet repayment	Live	One mainnet pool. The pot is funded only from interest that pool paid.
After the first repayment	Book	Three to five shops, each in its own vault.

Not on this map: a mint to refill the pot, or an institutional RLUSD book.

6. Before a deposit

Both amendments must be enabled, and held, on mainnet. Until the Amendments object shows that, the deposit control stays off. Devnet can be wired earlier. Both amendments were already enabled there in October 2026.

Xaman is the wallet. The first build connects an account and can request a test signature. It does not send a mainnet payment while the flag is off.

7. Team

The 10 percent team bucket covers four published roles.

McQAK, Founder

McQAK has worked in web3 on product and treasury. At Duck Bank the role is the desk: which shop is listed, the cap, and the terms on the pool.

Donald QAK, CTO

Donald QAK has worked in web3 engineering. At Duck Bank the role is the app, the Xaman connection, and the vault path once XLS-65 and XLS-66 are enabled.

Della, Marketing

Della has worked in web3 marketing. At Duck Bank the role is the channel, the shop listings, and the public note when a pool opens or repays.

Huey QAK, Developer

Huey QAK has worked in web3 development. At Duck Bank the role is the pool page, the listing lock check, and the test signatures.

8. References

Preview shell: trustline-tan.vercel.app. Deposits are gated.

Standards: XLS-65 Single Asset Vault. XLS-66 Lending Protocol. XRPL known amendments.

Venue: FirstLedger. 50 XRP starting liquidity, burned. AMM fee 1 percent. Anti-sniper 15 minutes. Issuer blackholed after launch.

Wallet: Xaman.
